Quick Guide on how to use our indicators (No Repaint) on the TradingView platform

Prime Reversal

Reversals are stronger when they are in the same direction of the trend. Bearish reversals with a red trend has more impact on price action. The same can be said with bullish reversals with a green trend.

Blue arrows = high probability reversals, they don't happen often.

Settings: Asset volatility - high (crypto, stocks), normal (indices, forex, or commodities).
Sensitivity - Move between 2 to 4, depending on the chart if there's not enough signals or too many.
Strength - Remove Weak when looking at smaller timeframes can produce false signals.

Prime Trend

Red Trend = Expect price to trend downwards.
Green Trend = Expect price to trend upwards.
Yellow Trend = Expect price to range, do not aim for a homerun, small trades.

Trend traders will want to reevaluate their position when the trend changes. This can be done with alerts, which will notify you in real time.

Settings: Short Time Frame (TF) for 30 min & less, Long TF for weekly and daily for crypto, stocks.
Normal TF for hourlies and daily for indices, forex, commodities.

Risk Tools

Variable Moving Average (VMA) is our preferred moving average. We use it to **manage risk**. Stop loss should follow the VMA, when there's a significant move in the opposite site of your trade you should not be holding the bag.

Alternatively, it can be used to **get into a position** if the trend or a reversal is in your favor. Always place a stop loss before a trade and **NEVER** trade more than 5% of your account per trade, less is better.

Auto support & resistance lines : Used to manage price targets and stop loss before entering a trade. **The longer the line the more important it is.** Extend them to the current price if needed to have a good understanding of important zones. Level 2 lines tend to attract the price.
